

Energy Audit of Humboldt State University, Science Departments

May 11, 2004

ENVS 410
Prepared by Kyle Lin
Jacques Du Bois

Introduction

As a part of its energy conservation program Humboldt State University has expressed an interest in an energy audit of the refrigeration units used by the various departmental programs in its science faculties. Environmental Sciences 410 has detailed a team of two students, Kyle and Jacques, to prepare an environmental report addressing these problems. A Problem Statement was developed for the report as follows;

Problem Statement

Extra energy costs may result from surplus or inefficient refrigeration units on campus. Those refrigeration units need to be identified

Goals

Within the limits of the course duration, a selective measurement of the consumption demands of some of the units could yield a variety of energy saving proposals.

Objectives

1. Develop a selective sample of units by type, size, use and age of units
2. Identify units in the sample that are over or under utilized, duplication or in need of replacement

Data collection method

We used 3 types of power meters: Digital Power, Kill a Watt and another one we returned to George Wright. We just need to plug in the meter into the outlet, and then plug in the refrigerator. We visited every chair of a department to get permission for putting the meters on refrigerators. Then, we went to talk to the stockman or person who is responsible for the refrigerators and get his help for putting the meters on the refrigerators. *were they all men?*

In the NR building

they are women.

Data collection and analysis

As a starting point for this report an Inventory conducted in June of 2001 by the College of Natural Resources & Sciences was obtained. The inventory listed by room number ,all of the refrigerators, freezers, incubators, cold rooms and growth rooms used by the individual departments in the science buildings on campus. Two, kilowatt hour meters were obtained from the Schotz energy center and the Plant Maintenance department enabling the completion of a random sample of approximately ten percent of the refrigeration units and some of the freezer units (a total of 26 units were measured out of a grand total of more than 190 units in all categories.

Size of refrigerator VS energy consumption

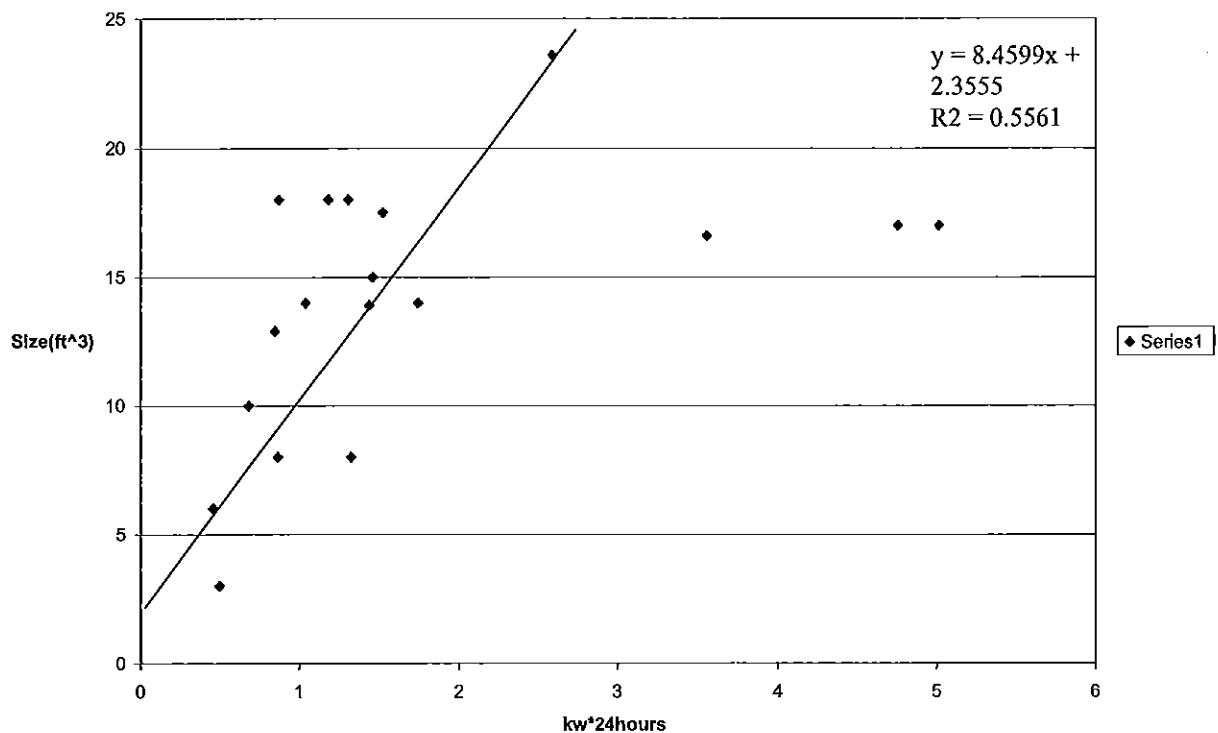

Figure 1. This graph shows the energy use of the refrigerators per day by different sizes of refrigerators. It also shows the steep trend line in terms of rate of change in size of refrigerator per energy use. This trend line has removed the 3 values which significantly change the slope of the trend. Since the slope of the line is steep, there is not significant change in energy use proportional to the size of the refrigerator.

If there were no effect of size on efficiency the line would be a 45 degree one.

Something seems to be off with the line if the three outliers have been removed. The line would be steeper since there are significantly more data points above the line if the three have been removed.

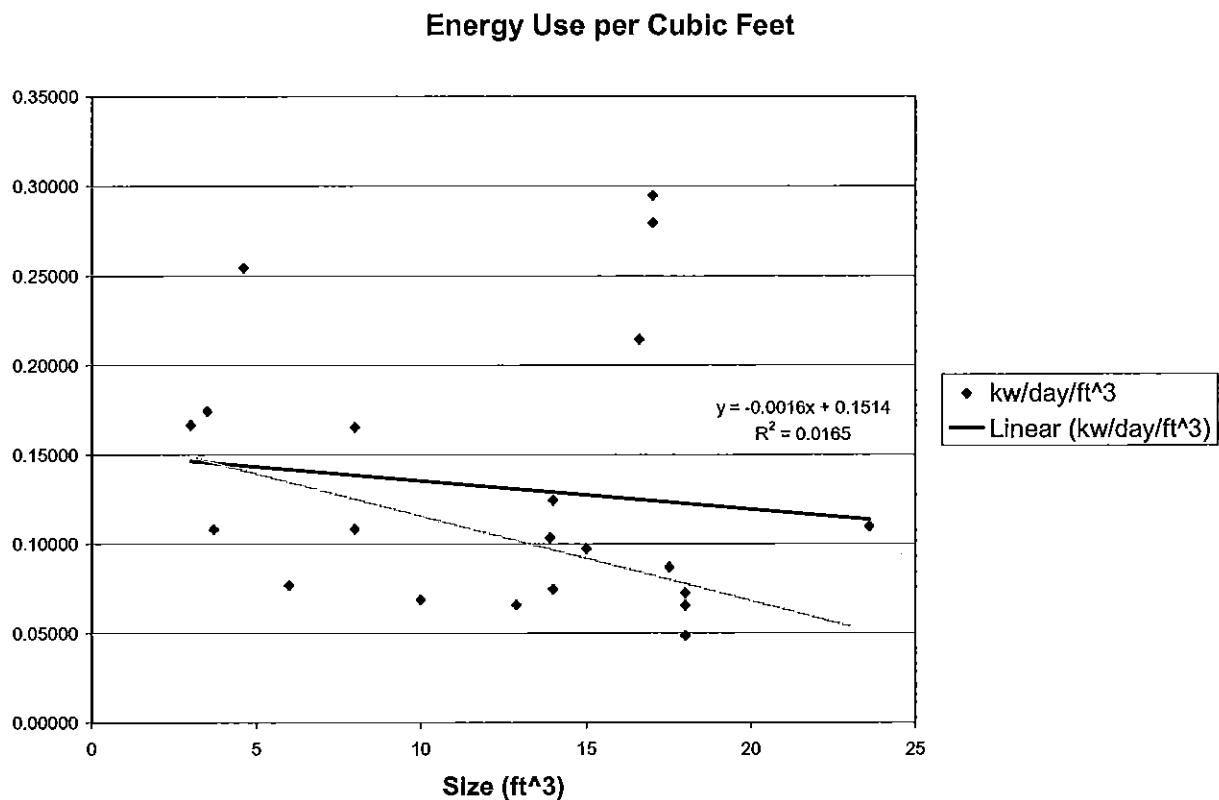

Figure 2. This graph shows the energy use per cubic feet for different sizes of refrigerators. This graph also shows the trend line in black (with 4 refrigerators on the trend) which is $y = -0.0016x + 0.1514$ and has R square value 0.0165. As you can see, the energy use per cubic feet is decreasing as the size of the refrigerator increases. There are 4 refrigerators which have low energy efficiency and don't fit in the trend line. These refrigerators are very old and we proposed to remove them in the implementation strategy. Once we remove the 4 refrigerators, the slope of the trend line become steeper, which is shown in the gray line. The trend line is $y = -0.0035x + 0.1439$ and has R square value 0.3143.

Alternative solutions in order of Priority

1. Extend the audit to the next semester and increase the size of the team to 6 or 8 members.
This will require buying leasing or borrowing at least 6 Kwh meters. Update the inventory since a number of changes in the number of units appears to have occurred since 2001. Conduct as large an audit as possible with each team member conducting 2 or more audits at a time.
2. Review and recommend unused or unplugged units for removal.
3. Examine the possibility of recommending the combining of uses within the refrigerators where two or more are used at the same location, or replace several small units with one larger unit.

this is more of a future recommendation

Obstacles to problem solutions

1. Frequently we found access to the units blocked, due to location in a locked room or pad locks on the unit itself. When this occurred we found the stock rooms, especially in the Biology,

Engineering and Chemistry Departments extremely helpful. They knew the location of the units and had the keys.

2. We also had a hard time finding the person (such as stockman) at the right time. Since they are busy at their regular work, we had a hard time finding the person when we visited. Sometimes, even though we find the person who has the access to classrooms, we had to come back because she or he is busy at work. Therefore, sometimes, we had to come back several times before we could get into the laboratory to collect the data. It turns out that this was the most time consuming part especially at the fishery and wildlife building. We could not access some of the outlets for three weeks. For future investigations, we would like to suggest getting a key from each department.

3. One of the more important items was the date of manufacture of the unit. Efficiency of units was increased by manufacturers over the decades. Finding dates on the units was impossible in some cases. Once again, the Biology and Chemistry stock rooms had that data in most cases. It was suggested that the Purchasing Department should have that data in their records.

Some refrigerators are locked and we could not get the information on size

5. The team had only two meters to conduct its audits. Given the number of units and the fact that 24 hour readings were performed on each unit, a random sample of approximately 17.5% of the units was possible.

6. The inventory used contained Refrigerators, Freezers, Incubators, Growth rooms, Warm rooms, Cold rooms and Humidifiers. All of these units use electricity. Due to limitations of team size and the number of meters available, only the first two categories were measured. A future team should consider adding incubators and humidifiers to their audit. The types of rooms listed above are probably all hard wired and would be extremely difficult to audit with the hand held meters. For example, we accidentally measured an incubator and the meter measured 9 Kwh per day. This tells us that there is a possibility that incubators may consume significant amounts of electricity. We strongly suggest that further research on incubators is needed to decrease the electricity use on campus.

7. Space limitations due to unit placement sometimes required the use of an extension cord to hook up the meter. This could permit the meter to be placed out of sight. Another item to consider for the team members tool kit is an expandable tape measure to determine the units inside dimension for cubic footage calculation.

8. I have talked to the stockman in biology department about the criteria for buying new refrigerator. It was surprising to know that there were no certain criteria and what they care about the most is the cheapest refrigerator proportional to the size. Due to the limited budget distributed to the department, they care more about short-term cost rather than long-term benefit. Each department tries to minimize the cost of buying equipment. The biology department also does not have incentives for buying energy efficient refrigerators. The electricity is paid by university when each department buys the refrigerator and uses it. This complex administrative process increases the inefficient energy use and cost.

9. Although the previous inventory shows that there are about 58 refrigerators in the biology department, many of them are broken, retired and/or replaced with new ones. The stockman said since he got his position, more than 7 refrigerators were replaced. The stockman and I did not try to count the number of refrigerators that exist in the biology department and we did not try to measure the new refrigerators. However, we have confidence that we measured most of the old refrigerators existing in the biology department. Since one of our purposes is to identify units in the sample that are over or under utilized or in need of replacement, we decided not to measure the new refrigerators.

Implementation Strategies

1. It became apparent to the team during the conduct of this study that an annual update of the inventory could lead to more efficient energy conservation and accommodate changes in the unit stock. With the use of a computer program, this could be accomplished by entering new acquisitions and deleting removals. Such a program would also yield an annual report for the university administration.
2. Science departments could be asked to re-examine unit uses and the possibility of combining uses that meet federal and state requirements.

Monitoring and Evaluations

1. The Plant Operation Department, with the cooperation of the Science Department stockrooms could be responsible for maintaining and updating the inventory based on the computer program.
2. Plant Operation would use its computer program to generate annual reports on the number and power consumption of the units.
3. Succeeding semester students from Environmental Science 410 would be responsible for completing, expanding and correcting the existing inventory.

Tables, Graphs and Related Data

1. Tables of units measured
2. Table: number of refrigerators measured by department
3. Meter specification
4. A sample of Amortization calculation
5. Generalized data collected during the course of the study

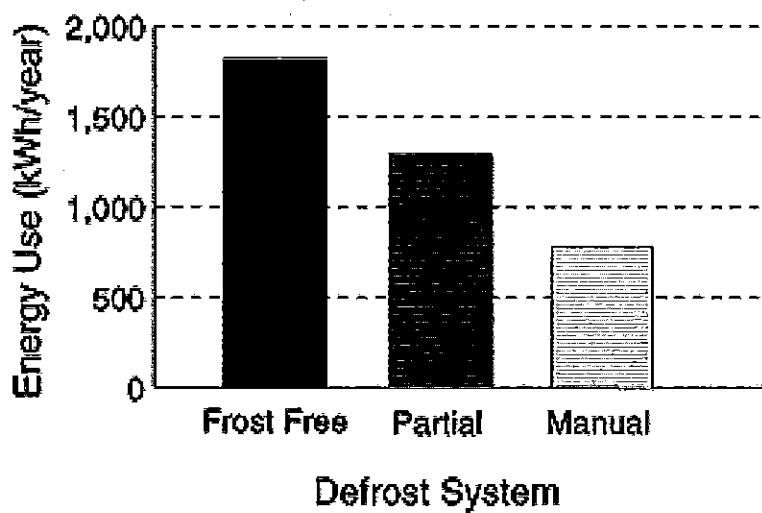

Figure 1. Average energy use of refrigerators by defrost system type

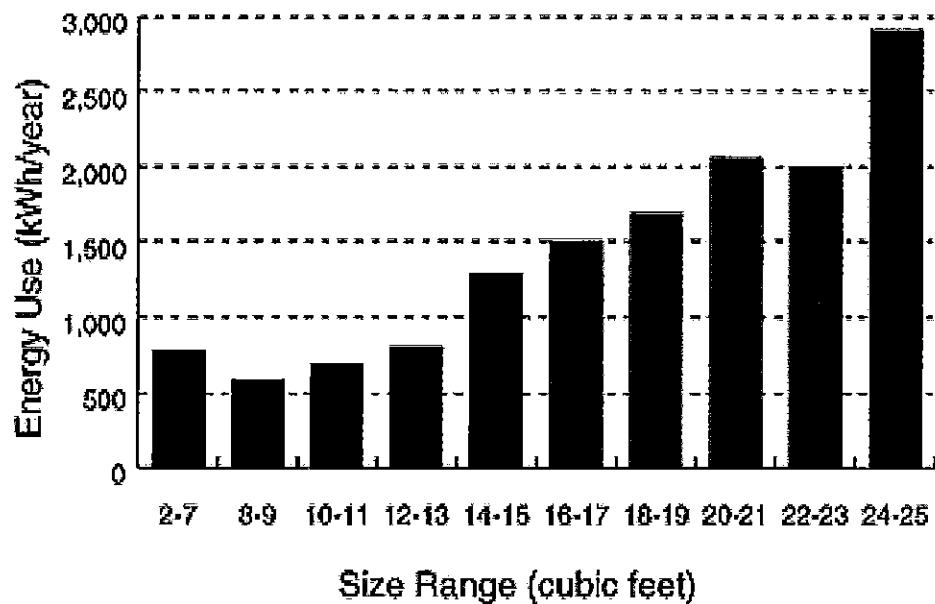

Figure 2. Average energy use of refrigerators by size

Finally, ARCA observed the change in energy use over time (see [Figure 3](#)). Refrigerators used much less energy 35 years ago because they were typically smaller and manual defrost. The energy guzzlers appeared in the 1970s (like the cars), and improved with federal energy standards over the last decade, with energy usage for a typical new refrigerator at about 800 kWh per year. When an 11- to 25-year-old refrigerator is replaced with a 1994 unit, expect that the house's electricity use will drop about 600 kWh per year. Even replacing a relatively new unit--five to ten years old--should save a few hundred kWh per year (about \$30 at 10¢ per kWh).

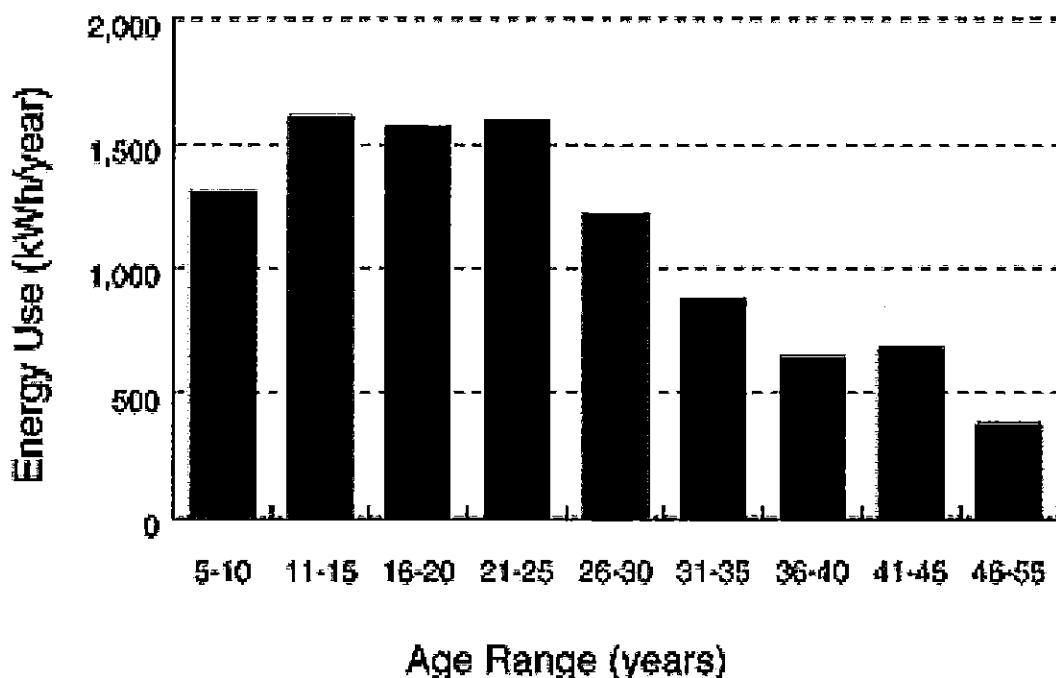

Figure 3. Average energy use of refrigerators by age.

Notes:

For Biology:

Each refrigerator is in an area for which there is a responsible individual. Those individuals report problems to Anthony Baker who:

- 1) assesses the problem,
- 2) sends the request for repair to Marty Reed, and
- 3) arranges for a temporary replacement and evacuation of contents.

different-sized refrigerators or freezers use the same amount of electricity per year, the larger model can be considered more efficient because it keeps more space cold with the same amount of electricity).

These lists represent the best-of-the-best in energy-efficient appliances. The ACEEE publication "The Consumer Guide to Home Energy Savings" offers a more extensive list of efficient appliances.

Please note that an asterisk (*) appearing in a model number indicates a digit or letter that varies with features of the appliance not affecting efficiency or capacity (for example, color).

TRENDS

United States Leads in Refrigerator

Efficiency

Japan recently adopted the International Standards Organization (ISO) energy test procedure for measuring the energy use of its refrigerators. This is a closed-door, constant temperature test, similar to that used by the U.S. Department of Energy. Now it is easier to compare the energy use of Japanese, European, and U.S. refrigerators. Figure 1 shows the range of energy use for all three groups. Energy efficiency is expressed in kWh per year per liter of refrigerator capacity. (This is how the Europeans calculate efficiency.) For reference, an 18 ft³ refrigerator has a capacity of 510 liters.

While Japanese refrigerator efficiency has stagnated in the last decade, and European refrigerators have made modest gains, the U.S. units have jumped ahead of the pack. Some American units provide twice as much refrigerator capacity for the same amount of energy consumed as the Japanese units. Whirlpool's Golden Carrot refrigerators, and similar models offered by Whirlpool's competitors, ensure that the gap will widen.

This data summarized in Figure 1 should be interpreted with caution. First, Europeans and Japanese use smaller refrigerators than Americans, so the actual difference in energy *use* per refrigerator is much less than these figures indicate. Second, the refrigerators provide slightly different amenities. The European models are more spartan than the Japanese and U.S. models. Third, the U.S. energy test procedure differs slightly from the ISO test procedure. The U.S. test can yield a 2% to 46% higher energy use for the same refrigerator (thus the U.S. models may actually be further ahead than shown).

Most of the U.S. efficiency improvement occurred during the late 1980s, when Europe and Japan lacked efficiency standards. These most recent results demonstrate that the combination of U.S. federal efficiency standards and utility incentives (like the Golden Carrot) have successfully catapulted U.S. manufacturers to the forefront of energy efficiency.

-Alan Meier

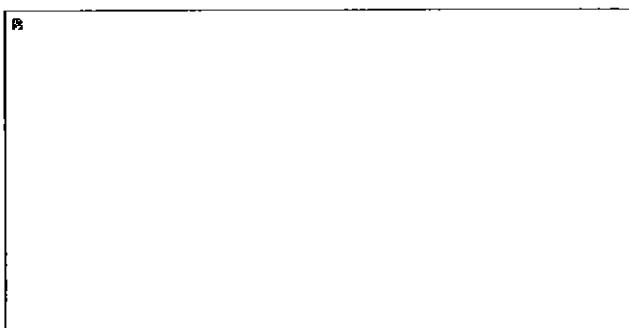

Figure 1. Comparison of energy consumption per liter of frost-free refrigerator-freezers manufactured in the United States, Europe, and Japan in 1995.

COLLEGE OF NATURAL RESOURCES & SCIENCES
Refrigeration Equipment Inventory – Part 2

June 2001

Department	Description of Item and What It Is Used For	Location of Item	Frost Free or Manual Defrost?	Brand/ Year (i.e., GE 1998)	Size (i.e., 15 cubic feet or 3'Hx2'Wx2'D)	Condition Description (i.e., Good, Fair, Poor plus any additional information)	Is refrigerator used/needed on a daily basis? Is current refrigerator used to capacity? The more full, the more energy efficient.	If replacement is possible, would you be satisfied with a smaller unit? If so, what size, type, model?
SAMPLE	Refrigerator, cultures	XXXX	Frost Free	Frigidaire 1989	19 cu ft	Fair; has had to be repaired several times	No, very little. Could be unplugged for extended periods or until needed. Not used from May - Sept.	Will consolidate and put contents in another. Refrigerator could be disposed of.
SAMPLE	Freezer, specimens	XXXX	Manual Defrost	Gibson 1956	21 cu ft	Poor, hole rusted through on inside	Yes, frequent use but not used to capacity	Smaller, 15 cu ft would be okay.
Biology	Coldroom, specimens	SciA 367	Frost Free		Built-in	Good	Yes, frequent use; not at capacity

S

	SO1070 (47090)	Engineering	28.5"D semester	In use	upgraded the electronics to new control panels a few years ago and that was the only substantial change in current model.
Forestry	Freezer, upright, seed storage	NR 108 HSU 51841	Manual Sears Kenmore, Model 21161 ~10 yrs old	Good; maintained each year before start of fall semester	No; this unit is full of seeds and is as small as is practical
Forestry	Gilson Respirometer, used to measure respiration in plant parts	NR 108 HSU SO1068 (46853)	Does not freeze, so never defrosted	Gilson 59"Hx 25"Wx 16.5"D (including superstructure)	Used for two weeks during class experiments; not plugged in when not in use
Forestry	Incubator (Humidity Chamber), maintain cultures of fungus or plants	NR 119A	N/A Environment Corp.	Good; maintained before it is used 35.5"Hx 33.5"D 26 cu ft	Seldom used and not turned on when not in use
Forestry	Refrigerator/Freezer, mostly chemical storage	NR 119A HSU 46015	Frost Free Sears Coldspot 25+ yrs old	19.2 cu ft Good; maintained as needed	Used constantly
Forestry	Growth Chamber, grow plants	NR 119A HSU SO1048 (48034)	N/A Western Environmental	84"Hx 107"Wx 36"D 70 cu ft	Used during semester courses
Forestry	Growth Chamber, grow plants	NR 119A HSU SO1049 (48035)	N/A Western Environmental	84"Hx 107"Wx 36"D 70 cu ft	Good maintained constantly; Plant Ops does refrigeration, plumbing and electrical maintenance; George Pease does other maintenance (i.e., electronics) (GROUP I MAINTENANCE)
Forestry	Growth Chamber, grow plants	NR 119A HSU	N/A Western Environmental	84"Hx 107"Wx 36"D 70 cu ft	Used during semester courses

							Newer units have better controls, but the compressors are relatively new and are water cooled.
Forestry	Humidity Chamber; adjust moisture content of samples	NR 222 HSU S01001	N/A	Environator Corp.	75.5" Hx 35.5" Wx 33.5" D	Good	Turned on when needed for courses and research
Forestry	Humidity Chamber; adjust moisture content of samples	NR 222 HSU S01002	N/A	Environator Corp.	75.5" Hx 35.5" Wx 33.5" D	Good	Turned on when needed for courses and research
Geology	Haskris Water Chiller, cools x-ray tube on XRD	FH 22		Haskris			
Geology	Kenmore, 21 cubic ft., Refrigerator/Freezer, cool sample storage	VMH 114		Kenmore	21 cu ft		
INRSEP	Refrigerators (two)	Hs. 38					
INRSEP	Freezer	Hs. 38					
Marine Lab	Refrigerator/Freezer; Food storage only	TML Rm. 116	Frost Free	Kenmore	15 cu ft	Good	Used daily and usually to capacity
Marine Lab	Refrigerator/Freezer; Chemicals, Reagents	TML Rm. 111	Manual	Coldspot	12 cu ft	Very poor, junk	Rarely used
Marine Lab	Incubator; algae cultures	TML Rm. 111	Manual	1970	Precision	17 cu ft	Poor; doesn't work, looking for parts
Marine Lab	Incubator; algae cultures	TML Rm. 116	Manual	1985	Precision	18 cu ft	Excellent, New
Marine Lab	Chest Freezer; fish for feeding aquarium animals	TML Rm. 121	Manual	2001	Mont. Ward	18.5 cu ft	Used often during the school year
NRPI	Explosion-Proof Refrigerator, small, chemical storage	NR 104 HSU01014	Frost Free	Marvel	34.5" Hx 24" Wx 24" D	Good	Used continuously; partial capacity
NRPI/ RWS	Refrigerator, chemical, specimen, and seed storage; perishables	NR 209 HSU52537	Manual	Hotpoint	61.5" Hx 28" Wx 23" D	Good	Used continuously; partial capacity
Nursing	Refrigerator, samples and medications cold	GH 122					
Oceanography	Refrigerator/Freezer; chemicals, radioactive isotopes	TML Rm. 111A	Manual	Coldspot	12 cu ft	Very poor, junk	Used occasionally
Oceanography	Incubator; seawater samples	TML Rm. 111A	Manual	Fisher Scientific	6 cu ft	Good	Used on Research Vessel

Oceanography	Refrigerator/Freezer; reagents	TML Rm. 112	Manual	1998	12 cu ft	Very poor, junk	Used occasionally	Should be disposed of
Oceanography	Refrigerator/Freezer; reagents	TML Rm. 112	Frost Free	Coldspot 1992	18 cu ft	Good	Used daily, but not to capacity	Will be used to replace Coldspot above, could be smaller
Physics	Countertop Refrigerator, film storage	SciA 471	Manual Defrost	Kenmore	7.0 cu ft	Good		
RRWS	Refrigerators, student club food service	NR 102 (Student Lounge)	Frost Free	Signature 2000, Model UAN15314	64" Hx28" Wx25"D, excluding coils; 15 cu ft	Good	Turned on when needed for student club food service	Retain
RRWS	Small Refrigerator, storage of media and chemical solutions	NR 106	Manual	Marvel	34.5" Hx24" Wx24"D	Fair; old, well-used, but works fine	Used continuously; partial capacity	Retain
RRWS	Water Bath, controlled temperature analyses	NR 122B	N/A	Forma Scientific, Model 2325	35" Hx34.5" Wx22.5" D, excluding control units	Good	Turned on when needed for courses and research	Retain
RRWS	Small Refrigerators (three), storage of perishables	NR 225		Sears Model 25152	64" Hx28" Wx24.5"D, 15.1 cu ft	Good	Turned on when needed for courses and research	Retain
RRWS	Upright Freezer, storage of specimens	NR 225B/C HSU53402	Manual	Kenmore, Model 25152	34.5" Hx24" Wx24"D, excluding coils	Good	Turned on when needed for courses and research	Retain
RRWS	Explosion-Proof, Refrigerator, small; storage of chemicals and samples	NR 225B/C HSU54710	Frost Free	No manufacturer's label	34.5" Hx24" Wx24"D, excluding coils	Good	Turned on when needed for courses and research	Retain
RRWS	Refrigerator, small, with freezer compartment; storage of chemicals and samples	NR 225B/C HSU51977	Manual	Marvel	34" Hx18" Wx17.5" D	Fair; old, well-used, but works fine	Not used.	Fulgum, MR Student Discard
RRWS	Refrigerator, small, with freezer compartment; storage of perishables	NR 225B/C	Manual	Dyna-Tone	27.5" Hx18" Wx17.5" D, excluding coils	Good	Used continuously; partial capacity	Retain
